```
Extract Parameters from Struct 1
function xdot = CoupledDyn(t,x,params)
% Usage: [tout,xout] = ode45(@(t,x) Coupledyn(t,x,params),tspan,x0,...
% Written by Garrett Ailts
% Description: Function takes in the current time, state, and a struct
% simulation parameters for a continuouse rigid body's (CRB) angular
% dynamics using the quaternion or DCM representation and returns the
% derivative of the state vector
% Inputs:
      - time since t0 (s)
응
 t
2
      - 17 x 1 (quaternion) or 27 x 1 (DCM) state vector
        representing CRB's attitude and angular rates
응
 params - struct containing CRB and simulation parameters
응
% Outputs:
     - 17 x 1 or 27 x 1 vector containing the rates of change
for the state
       paramters
```

#### **Extract Parameters from Struct**

```
gg_model = params.gg_model;
mag_model = params.mag_model;
atm_model = params.atm_model;
SRP_model = params.SRP_model;
J2on = params.J2on;
mu = params.Earth.mu_e;
R = params.Earth.Rmean;
J2 = params.Earth.J2const;
mag_epoch = params.Earth.mag_epoch;
I = params.sc.IB_b;
```

```
start_epoch = params.sc.start_epoch;
mb = params.sc.mom_b;
est_method = params.sc.est_method;
```

#### **Useful Values**

```
day2sec = 86400;
I3 = [0 0 1]';
r = norm(x(1:3));
if length(x)==27
    Cba = reshape(x(7:15),[3 3]);
    wba = x(16:18);
else
    Cba = Quat2DCM(x(7:10));
    wba = x(11:13);
end
wbaX = crossMatrix(wba);
```

### **Check for Earth Impact and J2 Inclusion**

```
if r<=R
    warning('Earth impact!')
end
% Check For J2 Inclusion
if ~J2on
    J2 = 0;
end</pre>
```

### **Forces and Moments**

```
gravity gradient torque
```

```
if qq model
    tau_gg = (3*mu/r^5)*crossMatrix(Cba*x(1:3))*I*Cba*x(1:3);
    tau_gg = 0;
end
% magnetic moment
if mag_model
    telapsed = t+day2sec*(start_epoch-mag_epoch);
   ba = EarthMagField(x(1:3),telapsed);
    tau_mag = crossMatrix(mb)*Cba*ba;
else
    tau_mag = 0;
end
% atmospheric pressure force and torque
if atm_model
    [f_atm, tau_atm] = atmosphereMdl(t,x,Cba,params);
else
    f_atm = 0;
```

### **Navigation**

# **Orbital Dynamics**

Calculate xdot1 with gravity and other forces

## **Attitude Dynamics**

# **Package Dynamics Together**

```
xdot = [xdot1; xdot2];
```
